Ala eddine Lusakula

has successfully completed the online, non-credit Specialization

Secure Coding in Laravel

Laravel, a PHP language framework, makes websites and apps faster and easier to build. In this course, we cover some of Laravel's built-in security features, best practices for securing your application, and real-life code and examples. Learners explore some of the most common ways to secure Laravel applications, configure applications to reduce the chance of leaking secrets and credentials, and validate user input and authentication methodologies. They also learn about user access control through gates and policies, how to eliminate SQL injection attacks and secure sessions with rate limits, as well as static analysis, tripwires and honeypots.
